Quality Established 100% Subsidiary in Seoul

Promoting the global alliance among Japan, USA, China, and Korea

TOKYO, Japan, January 29th – Quality Corporation (Head Office: Chiyoda City, Tokyo President: Kiyoharu Ura) announced that Quality has established “QualitySoft Corporation” in Korea as an overseas-affiliated company in the presentation of its business plan at “Vision Q 2003” meeting.

In Korea, since its economic crisis in 1997, excellent technicians have drained off from the business group companies, and numbers of venture companies with high-level technology have emerged. The purpose of the newly established QualitySoft is to find out the newest technologies and products that meet market needs through the alliance with Korean companies who are promoting strategies for next generation broadband, and to integrate those technologies and products with Quality products.

Since its foundation, Quality regards the improvement of customer satisfaction and the creation of the value for its customers and partners as its main theme. To realize it, QualitySoft USA was established in 1996 for the purpose of investigation of the market of USA as the advanced country in the field of the information technology, then SRI Corporation was established in 2001 in Nanki Shirahama for the purpose of establishment of the system of the guarantee of quality, and the last year QualitySoft Shanghai Ltd. was established for the purpose of the improvement of the speed of product development. This time, Quality’s systems of product development, guarantee of quality, and customer support have been consolidated and Quality has taken a first step toward the “world-nationality” company as the objective presented in “Vision Q”.

Think Global, Act Local.

Each base has global eyes and plays its role upon its regional characteristic. Based on such a spirit, Quality group companies will promote global alliance for the creation of the value, customer satisfaction, which is the aim of Quality group.

On IT asset management:

Computers and software packages in a company are increasing day by day, because of the shift of the society to the networking, and because of investment on information technology for more efficiency. In addition to them, mobile computers as sales tool have been rapidly spreading. In this situation, it has become a heavy burden for a system administrator to manage IT asset properly.

On the other hand, companies are requested to take compliance and security measures to deal with software piracy to which penal regulations became heavier, to deal with the leakage of company data that may harm the confidence, and to deal with increasing infections of computer viruses. Grasping and management of the circumstance of IT asset has become more and more important as a part of the measures.

QND Plus is an IT asset management tool that automates and lightens system administrators' complicated tasks.

QND Plus was awarded "2001 Information Month Promoting Conference Chairman Commendation to recognize a contribution of Information Processing System for Promoting Information Technology" for its excellent feature.

Press Release

Main features of “QND Plus”:

- It collects hardware and software information of client computers so that we can grasp the current situation of IT asset information, and enables smooth asset management by making an inventory ledger. It can also collect data from mobile machines and stand-alone machines.
- Distribution of software, and other remote control from the system administrator can be performed to maintain the stable environment of client computers.

Major Merits by introducing “QND Plus”

- The system administrator can check if the license number is neither too many nor too few upon “license ledge” so as to avoid the illegal use of software
- The circumstance of hardware and software asset can be accurately grasped so that a company can make an effective investment plan. And relocation and more effective use of computers, such as moving computers from R&D section into general affairs section, will be possible.
- By correctly grasping the status of the versions and security patches for operating systems and Internet Explorer, the computers that can be security hole can be listed up. By installing anti-virus software to those computers, timely measure for viruses becomes possible.
- By introducing the unified management of computers in a company, checking out and in the computers can be detected to avoid the leakage of company data.
